

The rapid development of manufacturing and computer technologies has generated new problems. To solve these problems modern tools and techniques are required. Artificial Intelligence (AI) is one of the most appropriate techniques for solving complex industrial problems. This series represents an effort to disseminate valuable information on applications of AI in industry which are becoming well-utilised throughout the world. AI has been recognised in many industrial countries as a means of solving complex problems arising in modern industry. All books in this series will highlight issues that arise in the development and application of AI systems. The series is intended for production and industrial engineers, managers, system designers and programmers.
